## Iterative method

To *iterate* is to perform the same procedure over and over again. Sometimes we can solve equations approximately by iteration.

For example, to find an approximate solution to  $x^3 + x = 5$ , we can rewrite this as

$$x = \sqrt[3]{5 - x}.$$

Letting

$$x_{n+1} = \sqrt[3]{5 - x_n}$$

and taking our initial approximation to be  $x_0 = 1$ , we find

$$x_1 = 1.58740105...,$$
  
 $x_2 = 1.50554966...,$   
 $x_3 = 1.51749158...,$   
 $x_4 = 1.51576099....$ 

We can see that the values of  $x_n$  appear to be approaching some number, which is a solution of the equation (in this case, 1.515980...).
